LLM reads data and normalizes it
apply food score
generate product score's explanation
display generated result
SDK?
python requests library
FastAPi
Handle food data text with LLM:
• separate ingredients list
• check for spelling and formatting errors
• identify naming conventions
• identify ingredient type and,
• do ingredient classification
run deterministic assessment logic
• enter LLM's ingredients and ingredient identification
• create application logic that incorporates the LLM output
Make an api call that combines:
• food score details
• relevant ingredients
• other information such as manufacturer or recency of ingredient formulation
